# exinda **Network**Orchestrator

Exinda Management Center

As the number of sites increases, it becomes more complex to manage and maintain an efficient network. Exinda Management Center is designed for organizations that need to maintain network health and application performance across multiple locations.

The solution provides complete management and configuration control of your Exinda Network Orchestrator appliances from a single console. It enables you to centrally manage all your applications, hosts, users, and activities across the network. You gain the ability to administer network policies and manage appliance configuration throughout your organization, with greater insight and efficiency.

✓ **Library —** Using this feature, you can create, store, and deploy the following: circuit types, virtual circuits, policy and policy sets, network objects, applications and application groups, schedules, application performance scores, service level agreements, and VLANs.

✓ **Configuration distribution —** You can easily distribute configurations to groups or subgroups, and all the devices in the group will automatically inherit the configuration. This can save time and improve distribution transparency.

✓ **Firmware updates —** You gain a central overview of all devices and the firmware each is running. You can choose to immediately update the firmware of one or more appliances. or schedule deployment of updates at a preferred time.

✓ **Reporting —** Reports help you understand where the network requires diagnosis or correction. You can generate reports for multiple devices using the central console, to improve speed and precision.
