AI-Driven Content Filtering for Smarter Email Security

Overview

GFI MailEssentials AI's CoPilot is an AI-enhanced assistant that streamlines the creation of content filtering rules within GFI MailEssentials. By combining targeted Q&A with GenAI technology, CoPilot helps organizations rapidly define customized email security policies that align with their data protection and compliance requirements—without requiring deep technical expertise.

Key benefits

Time efficiency

Traditional rule creation is manual and time-consuming. CoPilot automates the process, allowing administrators to configure customized content filtering rules in minutes. This reduces repetitive tasks, frees up IT resources, and ensures consistent policy implementation.

Compliance alignment

CoPilot identifies applicable regulations (e.g., GDPR, HIPAA, ISO) based on business location, data types, and industry. It recommends and creates rules required for compliance, helping reduce risk and audit preparation time.

Customized DLP

Security needs vary across industries. CoPilot builds filtering rules based on your organization's business structure, customer locations, and data categories—providing tailored protection rather than one-size-fits-all templates.

Operational flexibility

Whether creating rules from scratch, refining existing ones, or supporting separate business entities, CoPilot offers flexibility to adapt rulesets as your organization evolves. Additional rules can be added, adjusted, or regenerated with minimal effort.

Improved accuracy and reduced risk

Al-generated rules help minimize human error and ensure that important filtering policies are not overlooked. CoPilot also highlights rules needing further input, ensuring configurations are complete and effective.
