KerioControl AI

FEATURE DOCUMENTATION

GFI KerioControl 9.6.1 - Firewall Rule Reports

New in Kerio Control 9.6.1

What Is It?

Firewall Rule Reports is a new feature in Kerio Control 9.6.1 that tracks and displays **per-rule traffic usage statistics** directly in the administration interface. Administrators can now see exactly which firewall rules are being matched, how often, and by what traffic — without parsing raw logs.

How to Enable

Firewall Rule Reports is enabled **per rule**, directly within the Traffic Rule configuration:

1. Go to **Firewall > Traffic Rules** in the Kerio Control administration interface.
2. Open an existing rule (or create a new one).
3. In the **Action** dialog, locate the **Accounting** section.

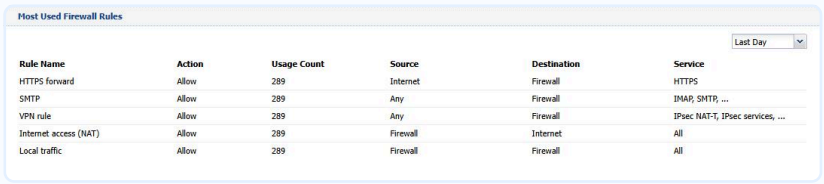

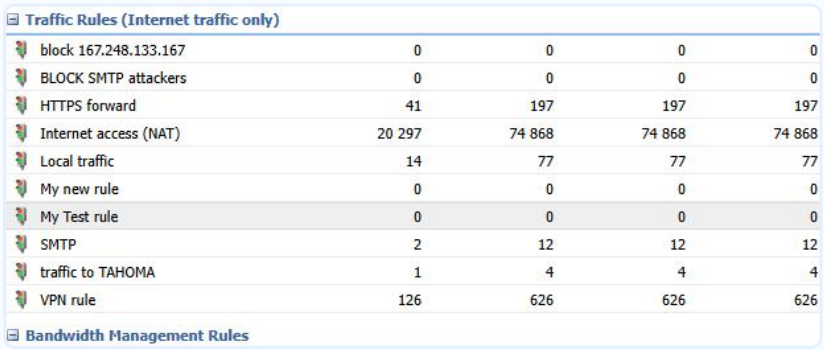

4. Check "**Internet traffic chart**".
5. Save the rule.

Tip: Only rules with "Internet traffic chart" enabled will appear in the reports. Repeat for each rule you want to track.

Where It Is Displayed

Once enabled, usage data appears in the **Dashboard** under two views:

Dashboard Section	What It Shows
Most Used Firewall Rules	 *Top rules ranked by hit frequency - Rule Name, Action, Usage Count, Source, Destination, Service*
Traffic Rules (Internet traffic only)	 *Full list of all tracked rules with individual usage counters*

The Value

For admins managing firewall policy:

Visibility at a glance
Instantly see which rules are actively enforced vs. rules that have never fired.

Faster troubleshooting
Correlate traffic volumes directly to rules without digging through connection logs.

No extra tools needed
Built natively into the Kerio Control dashboard; available as soon as 9.6.1 is installed.

Policy hygiene
Identify and safely remove stale or redundant rules with confidence.

Compliance-ready
Demonstrate to auditors that specific access controls are active and in use.
