KerioControl

ONE PAGER

FOR BANKS & CREDIT UNIONS

Zero Trust segmentation and audited control at every location.

Next-generation firewall and unified threat management deployed on your own infrastructure, at the edge of every location, with no per-site VPN bill.

Deny all
by default

Every connection across every location is blocked unless explicitly permitted and mapped to verified identity (AD/LDAP). A compromised device or credential cannot pivot to other zones.

Zero Trust segmentation, by default

How it works: gateway mechanism, then AI

1 — On-premises deployment
Virtual appliance, your own hardware, or a dedicated NG-series appliance: core traffic and policy enforcement run on infrastructure your institution controls.

2 — Layered VPN access control
Credentials, then two-factor authentication, then a hardware-bound Trusted Device check (7-attribute fingerprint, admin approve/revoke, full audit trail).

3 — Self-monitoring uptime
Watchdog continuously checks network, firewall, VPN and IPS services and auto-restarts any that fail, logging a crash dump for review, with no manual site visit.

4 — AI-assisted threat blocking (Shield Matrix)
Cloud AI and global honeypot intelligence block malicious IPs before they reach the network; threat intelligence refreshes every 15 minutes, with no added load on the appliance.

Compliance fit: global baseline

Basel Committee: operational risk & resilience principles Active/passive high-availability failover (one license covers both nodes) plus Watchdog self-recovery of core network services.	Supports
Access control & segregation of duties (US GLBA/FFIEC; EU DORA; UK FCA/PRA; Singapore MAS TRM; Australia APRA CPS 234; Canada OSFI B-13) Zero Trust deny-all segmentation with identity-mapped rules, plus a full admin audit trail of every device approval, denial and revocation.	Capability
Centralized oversight across locations GFI AppManager AI allows you to manage multiple appliances and many sites from one console.	Capability
